

The background of the slide is a high-speed photograph of water splashing, creating a dynamic and textured blue surface with many droplets and ripples.

# High Performance Computing in the Cloud to Support Weather, Water, and Climate. A Serverless Computing Implementation of Flood Inundation Mapping (FIM)

*Robert (Rob) Hanna, Rob Pita-Gonzalez, Corey Krewson, Nick Chadwick, FIM Development Team*

# HUC8'S, Rivers, DEMs and Rating Curves

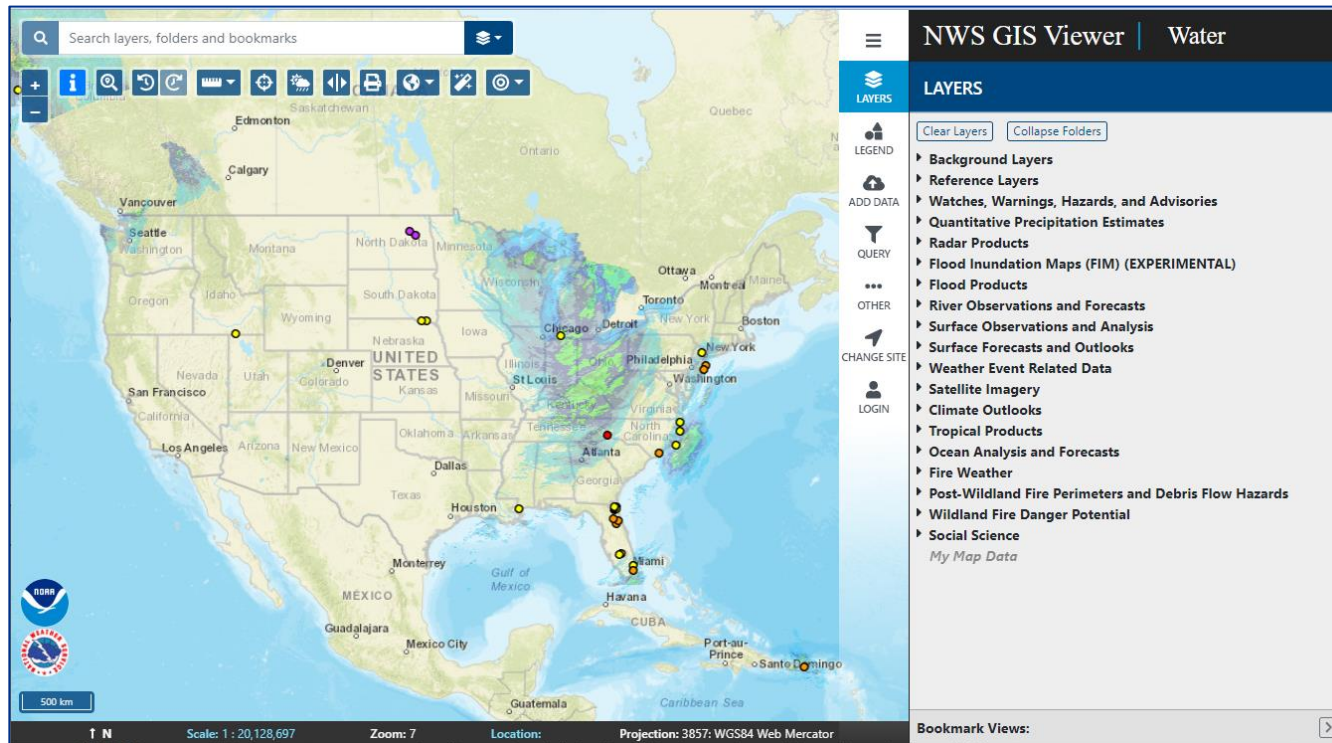

The data created during this process supports a wide range of products and services for NOAA/OWP and various affiliates

# National Weather Service GIS Viewer

<https://viewer.weather.noaa.gov/water>

# Complex Workflow

---

## Primary Processing (4 Major Steps)

**Originally  
59 Hours**

500 gb RAM  
80 CPU Cores

**Step 1: unit pre-processing**

**Step 2: unit processing**

- 2,148 units (multi-processing)
  - 47 sub-steps
  - 29 average number of branches (child unit) = each 34 steps
- 58,000 branches total

**Step 3: Post-processing**

**Step 4: Automated Testing Scripts**

# Complex Workflow

---

## Secondary Processing

**Originally  
57 Hours**

**Minimal  
Multi  
Processing**

### Other Steps:

- Docker image builds
- Copying to other environments / departments
- Creating secondary data
- Cleanup

**Total Hours = 116 (in parts ~7 days)**

**Output Sizes = 2.9 TB**

# Serverless Computing Advantages

---

- **Highly Parallelizable**
  - Concurrent Processes via Fargate at Unit Level
- **Reliable**
- **Serverless Architecture**
- **Scalable**
- **Cost Effective**
- **Terraform**

**Primary Processing = 59 hours -> 9 hrs (so far)**

**Secondary Processing = 57 hrs (WIP)**

**expected to drop to approximately 12 hrs or less**

# Overview of Cloud Resources

---

- AWS Step Functions - Resource Orchestration
- AWS Elastic File System (EFS) - Inputs and Outputs
- AWS Elastic Container Service (ECS- Fargate) - Compute Environments
- AWS Lambda - Serverless Functions to Perform Auxiliary Steps
- AWS CloudWatch - Logging
- AWS Cost Explorer - Calculate Costs
- AWS EC2 - Development Environments and a Production EC2 for Larger Tasks

# AWS Processing Overview

- Step Function / State Machine
- Fargate / Docker Image /

**Start execution**  
Start an execution using the definition of the state machine. [Learn more](#)

Name  
fim\_4\_4\_0\_0

Input - optional  
Enter input values for this execution in JSON format

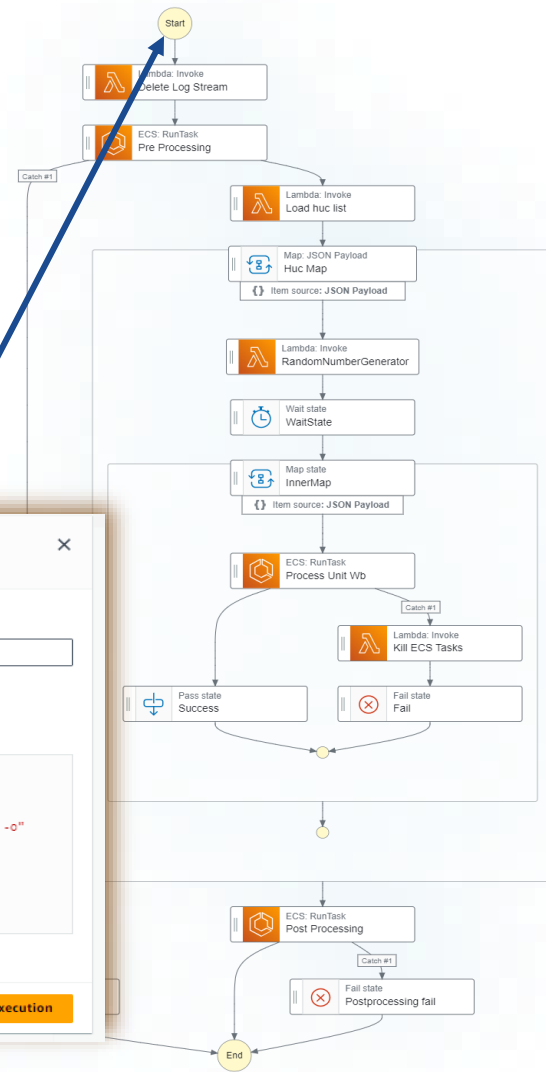

[Format JSON](#) [Export](#) [Import](#)

```
1 {  
2   "RUN_NAME": "fim_4_4_0_0",  
3   "HUC_LIST_FILE_NAME": "included_huc8.lst",  
4   "PRE_PROCESS_RUN_COMMAND": "fim_pre_processing.sh -n fim_4_4_0_0 -u /data/inputs/huc_lists/included_huc8.lst -jb 6 -o"  
5 }  
6

# Step Function State Machine - Workflow

Lambda

# Step Function State Machine - Workflow

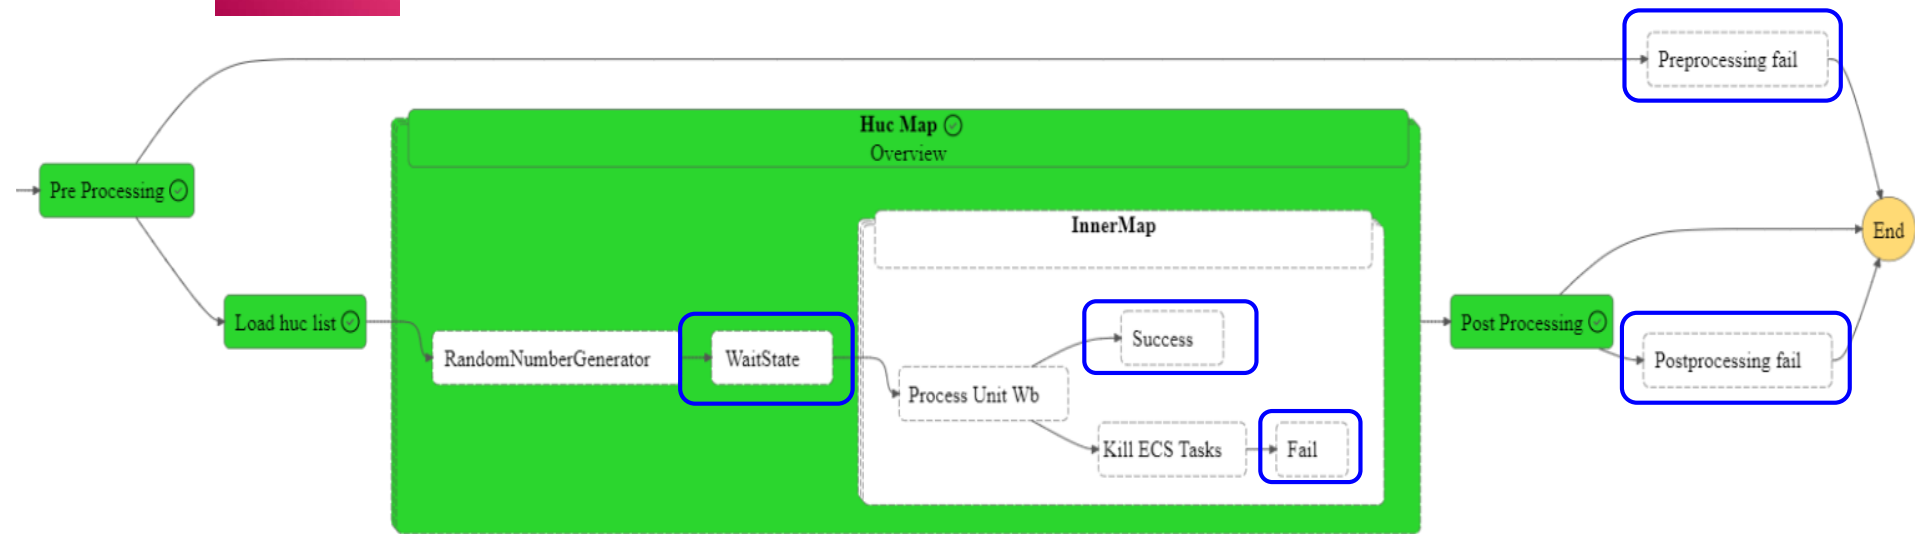

ECS Task Definition  
(Fargate)

# Step Function State Machine - Workflow

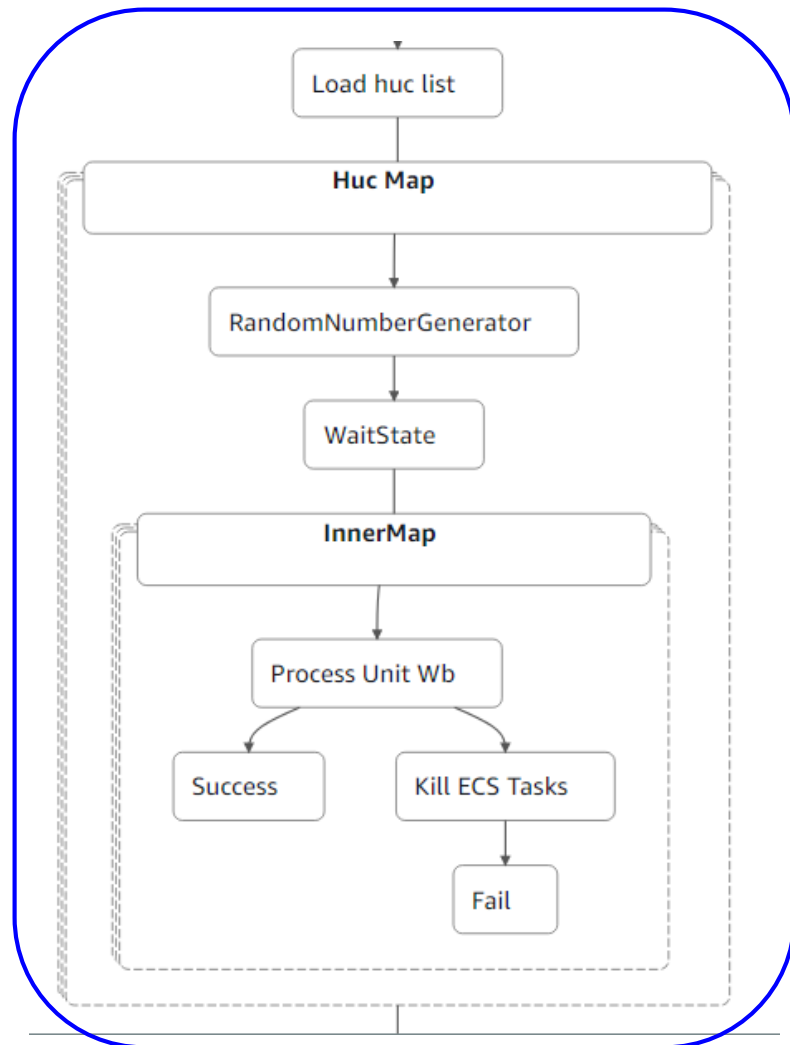

## State Machine Control Flow

# Step Function State Machine

## Outer Huc Map

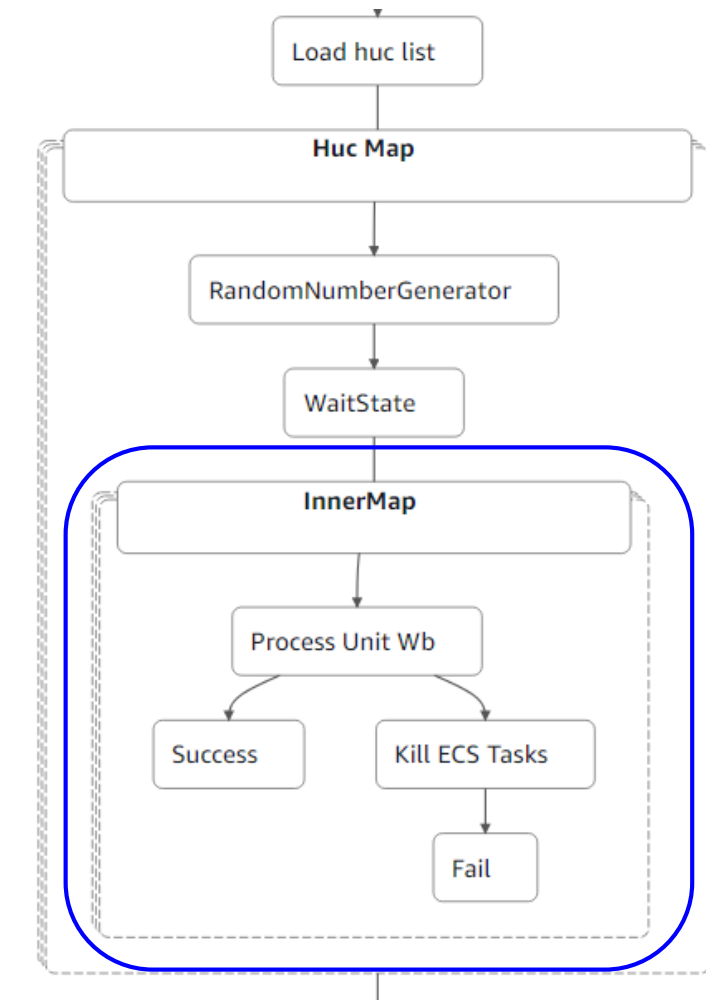

- Load HUC list
- 40 Units at a time (until all 2,138 done)
- Random Number Gen
- Wait
- Inner Map

# Step Function State Machine

## Inner Map

- Process Unit WB
- 40 Units at a time
- Each is an ECS Fargate / Docker Image

# Why Step Functions and ECS over AWS Parallel Cluster?

---

- The FIM computations rely heavily on writing and reading files passed from subroutine to subroutine
- Nested parallelization (Units → Branches)
- Refactor Time
- External Collaborators (Universities, Students, Scientific Community)

# Open Source

---

- Code contributions, public GitHub repo
- Code can be run without AWS
- Leverages Docker technology

<https://github.com/NOAA-OWP/inundation-mapping>

# Next Steps

---

- **Primary Processing**

- Performance 59 Hrs → 9 hours → goal of 2 hours
- Add Post Processing optimizations
- Automated Testing System

- **Secondary Processing**

- Performance 57 Hrs → goal of 12 hours
- Creating Secondary Data
- Copying / Cleanup

# Future Opportunities

---

- 10 meter to 3 meter resolution
  - 9x processing and output volume. AWS can easily scale up
- Code Optimization (memory objects)
- AWS Batch
- AWS RDS
- AWS EC2 Processing
- S3 Direct Integration
- DevOps / Github integration
